A screenshot of a mobile chat application. The interface features a top navigation bar with a grey background, containing a 'Search' button and a 'New' button. On the left side, there is a vertical list of contacts, each represented by a colored circular avatar. The contact 'Steven Dang' is highlighted with an orange background. The main area of the screen displays a chat conversation. It begins with a blue message bubble from the contact saying 'Can you toss in an theme?'. This is followed by a grey message bubble from the user saying 'Sure!'. At the bottom of the screen, there is a grey input field with the placeholder text 'Type Message' and a 'Send' button.

What could you do with an old bowling pin?

This area is scrollable so that the facilitator can scroll through all of the ideators' progress

When facilitator enters a task, it gets automatically put into the task queues of the ideators. Checkmarks show that an ideator has taken the task already.

Ideator view

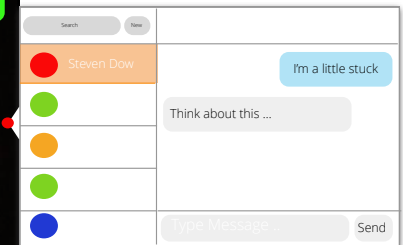

When ideator presses enter, all theme ideas show up in a column. However, the large workspace is so the ideator can move the items around for better visual organization

The lightbulb gets brighter as more ideas are generated. This serves as a motivation for the ideator to keep ideating, or to take some pressure off the ideator if they are stuck. This is what a full bright lightbulb should look like. How would we show them this? The number of ideators and ideas flowing (AKA number of brainstorm ideas submitted) updates in real time.

We don't want the ideator to see the ideas of the other ideators in case that will influence their ideas. However, we do want to show them the task queue.

Ideator submits ideas for task here via drag and drop. The ideas automatically get added to the list with that theme.

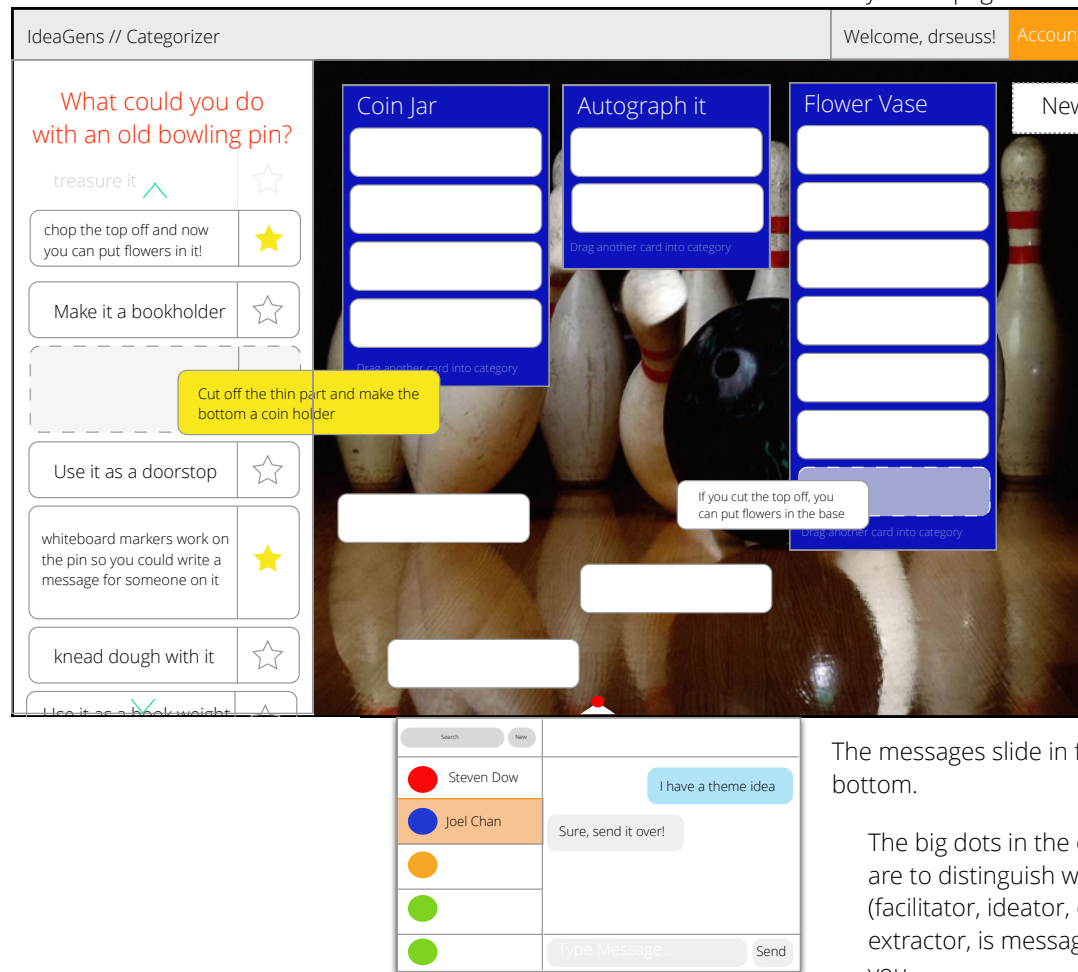

The messages slide in from the side of the page so that it doesn't get in the way of the enter text section

The big dots in the chat are to distinguish who (facilitator, ideator, other extractor, is messaging you

Categorizer view

Can scroll through all the lists horizontally in the main body of the page

Starred themes are those that the facilitator likes. categorizer should pay closer attention to those

Ideas that pull out of the real time feed are yellow if they were starred by the facilitator

This side panel is collapsable so the categorizer can pick the ideas, then collapse to focus on organizing.

What is the best way to prevent cognitive overload of the categorizre from the volumn of ideas coming in?

How does the categorizer get the new themes? Is is feasible to have them automatically create new lists in real time?

These categories get saved into a dictionary database so it can visually displayed in the result screen.

The messages slide in from the bottom.

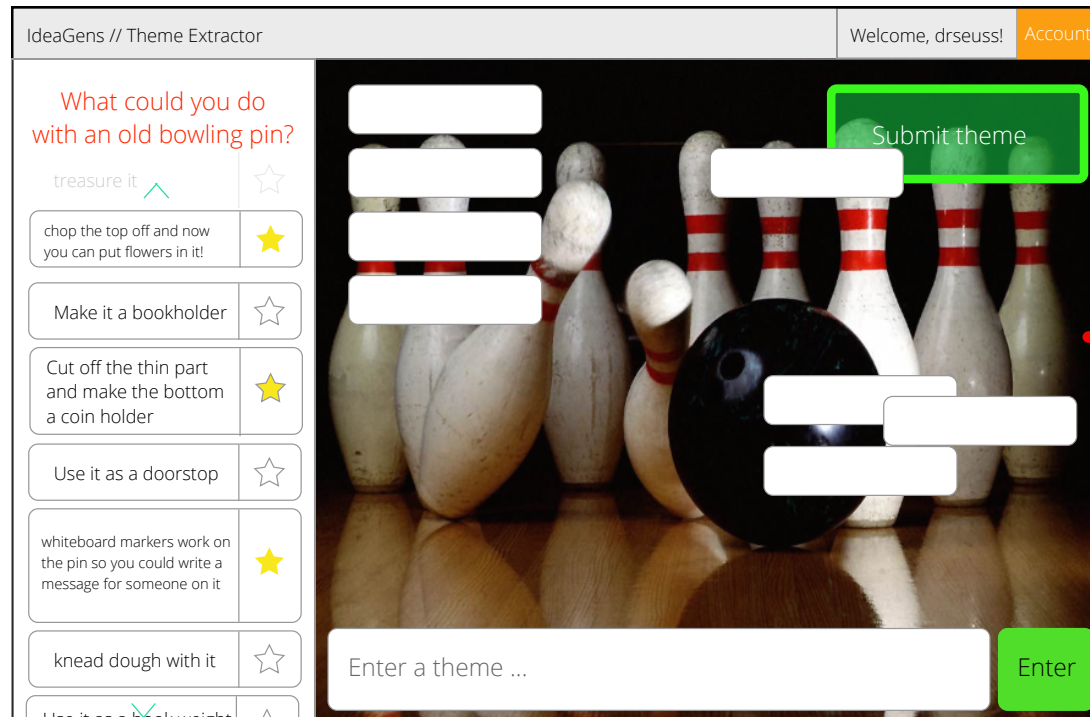

The big dots in the chat are to distinguish who (facilitator, ideator, other extractor, is messagin you

Theme Extractor view

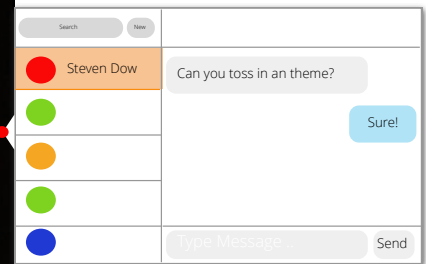

When extractor presses enter, all theme ideas show up in a column. However, the large workspace is so the extractor can move the items around for better visual organization

Starred themes are those that the facilitator likes. categorizer should pay closer attention to those

This side panel is collapsible so the categorizer can pick the ideas, then collapse to focus on organizing.

Extractor submits final ideas here via drag and drop. They automatically become list categories in the categorizer view

The messages slide in from the side of the page so that it doesn't get in the way of the enter text section

The big dots in the chat are to distinguish who (facilitator, ideator, other extractor, is messagin you
